Option 1

Base plates drilled and bolted resting on the ground, with a folded flat bar fixed back to the bridge wall for stability. The flat bar would be the minimum width and would sit flat against the curved wall.

Option 2

The usual method would be to embed the base fixing as shown but without any fixing to the wall. The precise depth would be a matter for further discussion with A J Wells. Please note that the maximum height of the lectern will be below the height of the parapet wall and dimensions are as shown on the plan and elevation.
