

Lighting Notes

The lighting strategy has been prepared with consideration of the adjoining woodland area and the presence of bats in the surrounding area.

The lighting scheme designer has clarified the following in respect of the lighting strategy:

- Viva City has been used so the CCT is 4000K and has No UV the Peak will be in the blue spectrum, but lower than the 550 nm that is referred to in the Bat Conservation Trust (BCT) guidelines.
- Whilst previous BCT guidance pushed people towards Sodium, recent research shows that LED lighting has the same effects at the same light levels so there is no benefit to using SON

It is therefore considered that the lighting strategy accords with the BCT guidance and that it will have a minimal impact upon the surrounding woodland area and the resident bat population
