

Function and design

In addition to their basic function of providing protection against rain and wind, glass canopies also offer the advantage of open, transparent architectural design. The tie bar canopy systems by ION Glass Ltd, which are available in different sizes, stand out by virtue of their functional and design features.

Proven quality which fulfils its promises.

The canopy is attached by means of the proven, single-point glass retainers. The entire system remains biaxially flexible through the use of forks and rings. The advantage of this is that the canopy structure is resistant to pressure and suction loading. Tie bars in special lengths are available on request.

System-based attachment

The new canopy system is an innovative total package which enables glass canopies to be attached with standardized glass retainers. The individual components of the system can be combined to suit the type of canopy and the substructure. The different components are made from stainless steel and have already proved their worth on numerous properties.
