

Lift Access Control

Ground Floor Lobby AV Panel and Proximity Reader

- All car call buttons except the ground floor would be locked from inside the lift car.
- No landing lobby lift call points would be locked from normal operation.
- Anyone gaining access to a lift without any access rights would not be able to travel to any floor other than the ground floor.
- Those presenting a permitted proximity device would unlock the programmed floor/s only.
- Please note that in the case of a duplex (2 lifts under the same group control) then the resident's floor would become unlocked in both lifts but there would be no visual indication of this in the lift car.

1. Resident Arriving

- Resident arrives at the ground floor lift lobby and calls a lift via the landing call button.
- When a lift arrives, they present their proximity security device to the reader on the lobby to unlock their floor only.
- The resident would then be able to enter the lift and press their relevant floor number on the car operating panel and travel in the lift.

2. Visitor Arriving

- Once gaining access to the ground floor lift lobby the visitor would call the resident via the ground floor AV panel.
- The visitor would have to also call the lift using the ground floor lobby button.
- Once the resident has confirmed the visitor, they would unlock their floor to the lifts via the access security device in their property.
- This would unlock their floor only to both lifts (no visual indication in either lift).
- The visitor enters the lift and selects the relevant floor.
- Travel is only permitted to the resident's floor.

3. Resident/Visitor Departing

- The landing lift call points would work as normal to call the lift from any floor lift lobby.
- The only permitted travel once in the lift car is the ground floor allowing exit from the building.

4. Travel between restricted floors (Resident Community)

- Visiting resident would have to travel to the ground floor and use the ground floor AV lobby panel in the same way as a visitor to gain access to a fellow resident's floor.

OR

- Both residents would have to permit access to each other's floors and have their proximity devices re-programmed to allow the multiple floors.
 - The visiting resident would still have to travel back to the ground floor lobby and present their proximity device to the lobby reader to unlock travel back to the desired floor.
 - When presenting their security device this would unlock all the floors permitted by that resident to both lifts (no visual indication).
- The same process would be used to return to their property.
